

## 1 Gamma Function

$$\int_0^1 \log(x) dx = \left[ x \log(x) - 1 \cdot x \right]_0^1 = -1!$$

$$\int_0^1 \log^2(x) dx = \left[ x \log^2(x) - 2x \log(x) + 2 \cdot 1 \cdot x \right]_0^1 = 2!$$

$$\int_0^1 \log^3(x) dx = \left[ x \log^3(x) - 3x \log^2(x) - 2 \cdot 3x \log(x) - 3 \cdot 2 \cdot 1 \cdot x \right]_0^1 = -3!$$

Observing the pattern, we can write,

$$\int_0^1 \log^n(x) dx = (-1)^n \cdot n!$$

Solving for  $n!$  we get,

$$n! = \frac{1}{(-1)^n} \int_0^1 \log^n(x) dx$$

$$n! = \int_0^1 \left( \frac{\log(x)}{-1} \right)^n dx$$

$$n! = \int_0^1 (-\log(x))^n dx$$

$$n! = \int_0^1 \left( \log\left(\frac{1}{x}\right) \right)^n dx$$

Let  $u = \log(\frac{1}{x})$ . Using the property of logarithms  $-u = \log(x)$ . Raising to the power of  $e$  on both sides, we get  $x = e^{-u}$  and thus,  $dx = -e^{-u} du$ . When  $x = 0$ ,  $u \rightarrow \infty$  and when  $x = 1$ ,  $u = 0$ . Therefore, the integral becomes,

$$n! = \int_0^\infty u^n (e^{-u}) du$$

Now, by the definition of gamma function,

$$\Gamma(n+1) = n! = \int_0^\infty u^n (e^{-u}) du$$

$$\Gamma(n) = (n-1)! = \int_0^\infty u^{n-1} e^{-u} du$$

Replacing  $u$  by  $x$ ,

$$\Gamma(x) = \int_0^\infty x^{n-1} e^{-x} du$$

## 2 Maclaurin's Series

Let  $f(x)$  be function of  $x$ . Goal is to write the function as infinite polynomial.

$$f(x) = a + bx + cx^2 + dx^3 + ex^4 + \dots$$

when  $x=0$ ,  $f(0) = a$  In order to find other coefficients we differentiate the function with respect to  $x$  and put  $x = 0$ .  $f'(0) = 1 \cdot b$   $f''(0) = 1 \cdot 2 \cdot b$   $f'''(0) = 1 \cdot 2 \cdot 3 \cdot c$  and so on. Looking at the pattern, the general form would be,

$$f^{(n)}(0) = n! \cdot (n^{\text{th}} \text{ coefficient})$$

Substituting in the above equation for coefficients, we get,

$$f(x) = \frac{f(0)}{0!} + \frac{f'(0)}{1!}x + \frac{f''(0)}{2!}x^2 + \frac{f'''(0)}{3!}x^3 + \dots$$

In Summation Notation,

$$f(x) = \sum_{n=0}^{\infty} \frac{x^n}{n!} f^{(n)}(0)$$

$\sin(x)$	$x - \frac{x^3}{3!} + \frac{x^5}{5!} - \dots$
$\cos(x)$	$1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \dots$
$\tan(x)$	$x + \frac{x^3}{2} + \frac{2x^5}{15} - \dots$
$\sinh(x)$	$x + \frac{x^3}{3!} + \frac{x^5}{5!} + \dots$
$\cosh(x)$	$1 + \frac{x^2}{2!} + \frac{x^4}{4!} + \dots$
$e^x$	$1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} \dots$
$\ln(1+x)$	$x - \frac{x^2}{2} + \frac{x^3}{3} - \dots$
$\tan^{-1}(x)$	$x - \frac{x^3}{3} + \frac{x^5}{5} + \dots$

Now, the more general expansion gives the **Taylor Series** which is shifted by  $h$ .

$$f(x+h) = \sum_{n=0}^{\infty} \frac{h^n}{n!} f^{(n)}(x)$$
